E-MELD

Electronic Metastructure for Endangered Languages Documentation

- 5 year NSF-sponsored project
- **Goal:** To aid in the preservation of endangered languages data, and the development of infrastructure for electronic archives
- **Participants:** LINGUIST List (Eastern Michigan U., Wayne State U.) U. of Arizona), Linguistic Data Consortium, Endangered Languages Fund)
Preservation, Intelligibility, Interoperability

The E-MELD Vision of Digital Language Resources

Gary Simons, SIL International
Helen Aristar Dry, Eastern Michigan U.
Preservation, Intelligibility, Interoperability

- Part 1: Toward Enduring Resources (Dry)
- Part 2: Toward Interoperable Resources (Simons)
- We also provide

Attention AIDS: Acronyms In Dubious Shapes
Source of E-MELD Recommendations

- Working groups of language engineers and documentary linguists
- At 5 E-MELD workshops:
  - 2001: The Need for Standards
  - 2002: Lexicons
  - 2003: Texts
  - 2004: Databases
  - 2005: Ontologies
  - 2006: Tools and Standards
E-MELD Vision of Digital Language Resources

- **Preservable**: formats are not vulnerable to physical decay or obsolescence of hardware & software
- **Intelligible**: content is easily understood by future scholars
  - “We don’t want to create another Rosetta Stone” (Whalen, 2003)
- **Accessible**: distributed resources are easily discovered and accessed
- **Interoperable**: documentation created by different scholars is easily searched, compared, and reused.

<tr>
<td>BETTER</td>
<td>Access</td>
<td>Create an archive-ready collection and deposit it with an archive</td>
</tr>
<tr>
<td>BEST</td>
<td>Interoperability</td>
<td>Format to facilitate automatic processing</td>
</tr>
</tbody>
</table>
Good practice for the Linguist:
Preservation of the format

An enduring file format is one that offers **LOTS**:

- **L**ossless
- **O**pen
- **T**ransparent
- **S**upported by multiple vendors

(Gary Simons, LSA 2004)
Lossless

- No content should be lost through compression
- Uncompressed file formats (lossless):
  - Audio: .wav, .aiff, .au (pcm)
  - Images: .tiff, .bmp
  - Video: .avi (depends on codec), rtv
  - Text: .txt, html, xml
- Compressed but lossless:
  - Audio: .ale (Apple Lossless Encoding)
  - Images: .gif (black & white only)
  - Video: jpeg2000 (new - 1:10 ratio)
  - Text: .zip
OPEN

- Prefer a file format whose specification is publicly available, i.e., "Open standard."
  - Exs: html, XML, pdf, rtf
- Information in proprietary file formats will be lost when the vendor ceases to support the software
Transparent

- Format requires no special knowledge or algorithm to interpret
- One-to-one correspondence between the numerical values and the information they represent, e.g.
  - Plain text: one-to-one correspondence between numbers & characters. Can be read by any program that handles text.
  - PCM codec (.wav, .aiff, cdda): One-to-one correspondence between the numbers & the amplitudes of the sound wave. Can be read by any program that handles audio.
Support by multiple vendors

- Makes a file format less likely to fall victim to hardware and software obsolescence.
- Is encouraged by use of open standards:
  - If a file format is open, anyone can create programs that handle it
    - Not necessary to reverse engineer the format or purchase the specification from the developer
    - So program development is less costly
Intelligibility: Preserving the Content

- So longterm preservation of the file format requires **LOTS**.
- But, for longterm intelligibility, the linguist must do even **MORE**:
- **Document** the:
  - **M**arkup
  - **O**ccasion
  - **R**ubrics
  - **E**ncodings
Intelligibility: Document the Markup

- Document all **markup**, whether
  - **Presentational**: make explicit the information encoded in the formatting
    - Bolding indicates “headword”
  - **Punctuational**: “A semi-colon separates the different senses of a word”
  - **Descriptive**: “<pos> stands for ‘part of speech’”
Intelligibility:

Document the Occasion

- Record the
  - Time & place
  - Type of speech event
  - Participants
  - Language(s)

- Best practice: use OLAC or IMDI metadata standard for interoperability

- OLAC = Open Language Archives Community: 15 element metadata standard developed for language resources
Intelligibility:
Document the Rubrics

- **Abbreviations:** list every abbreviation and what it stands for
- **Terminology:** define the concepts used in the language description
  - “Absolutive” refers to an unpossessed noun in Uto-Aztecan.
- **Glossing rules:**
  - “A tilde represents reduplication”
Intelligibility:
Document the **Encoding**

- **Encoding:**
  - Identify the base character set
    - Example: ISO 8859-1, CJK
  - Document every non-standard character used
  - Or use Unicode (recommended)
    - Unambiguous standard
    - Promotes interoperability
  - With Unicode, document every character placed in the Private Use Area.
Better Practice: Promote Discovery & Access

- Deposit the resource in an archive
- A file with **LOTS MORE** should be stored in an archive that offers **MUCH**:
  - Migration
  - User access
  - Cataloging
  - Harboring
Archive Recommendations: Offer MUCH:

- Migration to new storage media and formats as technologies change
- User access within the bounds of IPR. Digital archives should provide more than local access (e.g., URLs) even if not interoperable with other archives.
- Cataloging: resources organized, metadata made available
- Harboring: resources conserved in a safe environment
## Scale of Practices for Archives

<table>
<thead>

E-MELD Vision of Digital Language Documentation

Part 2: Interoperability

Gary F. Simons
SIL International
E-MELD End Vision

- The digital products of the linguistics community’s efforts to document endangered languages:
  - Will endure far into the future
  - Will be found and used by any who have an interest in the documented languages
  - Will enable our knowledge about the world’s languages to be combined and searched to an unprecedented degree
The interoperation problem

- Once the resources that linguists create are being preserved for the future in a host of archives:
  - How can potential users ever find the resources they are interested in?
  - How can users search the combined work of different linguists, especially when they have used different markup or terminology?

- Solutions require archives and resources to interoperate.
Services to the rescue

- The user can’t solve these problems—there are too many archives to visit.
- An archive can’t solve these problems—all the other archives have to be included.
- A service can solve the problems—
  - An automated system that supports inter-operation among all participating archives.
  - Provides a single point of entry for users.
  - Developed and maintained by an institution.
The key players

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>User</td>
<td>A person who wants to use language resources</td>
</tr>
<tr>
<td>Linguist</td>
<td>A person who creates language resources</td>
</tr>
<tr>
<td>Archive</td>
<td>An institution that curates language resources</td>
</tr>
<tr>
<td>Service</td>
<td>An institution that makes language resources interoperable</td>
</tr>
</tbody>
</table>
The big picture

Linguist

Resources

Archive

Requests

Service

User
Two kinds of interoperation

- **Shallow interoperation**
  - Based on the surface content of plain text
  - Generic to all problem domains
  - Based on the ubiquitous HTTP infrastructure

- **Deep interoperation**
  - Based on underlying concepts and structures
  - Built for a specific problem domain
  - Requires a domain-specific infrastructure (e.g. protocols, markup, controlled vocabularies)
Supporting shallow interoperation

- Such services already exist: e.g., Google
- If an archive exposes its catalog as web pages, it will have shallow interoperation at the level of metadata.
- If an archive provides web links to resource content, it will have shallow interoperation at the level of data content.
- Easy for the archive to do and easy for the user to use.
So what’s the problem?

- Lots of noise (= Low precision)
  - The words used to formulate the query have many irrelevant senses. E.g.
    - Ega is the name of a language
    - It is also an acronym with unrelated meaning

- Lots of drop out (= Low recall)
  - The target concept may be in the text as a word different from the one in the query. E.g.
    - Synonyms; Alternate names
An example of shallow search

- Using Google to look for an Ega dictionary
  - Try: Ega dictionary (120,000 hits)
    - Enhanced Graphics Adapter, Enterprise Grid Alliance
    - 19: E-MELD School of Best Practice: Ega Lexicon
    - 92: Endangered Language Foundation
  
- Try: Ega lexicon (24,500 hits)
  - 1: E-MELD School of Best Practice: Ega Lexicon
  - 2: Ega Web Archive (at Bielefeld)
  - Next 98 hits include 4 that refer to the language
An example of deep search

- Using OLAC to look for an Ega dictionary
  - Open Language Archives Community
  - Uses controlled vocabulary to identify language
  - Uses controlled vocabulary for linguistic types

- Language code='ega' and Type='lexicon' (6 hits)
  - All are relevant items from U Bielefeld Language Archive
  - Typescript, recording and transcripts of word lists
  - Data files: Shoebox, XML, CSV
Evaluation scale:
Levels of practice for archives

- **Bad:** Does not do MUCH
- **Good:** Does do MUCH
- **Better:** And supports shallow interoperation
  - To increase recall in generic services
- **Best:** And supports deep interoperation
  - To increase precision via domain services
Supporting deep interoperation

- An archive supports deep interoperation if:
  - Its resources use XML markup so that machines may interpret their contents
  - The XML encoding uses domain-specific controlled vocabularies
  - It implements the protocol of a domain-specific service so that the service can access its deep resources
Dimensions of service

- For all services:
  - Closed vs. Open
  - Generic vs. Domain specific

- Further dimensions for domain-specific services:
  - Metadata vs. Full content
  - Precision-supplied vs. Precision-added
Good and Better in services

- The second is better than the first:
  - **Closed vs. Open**
    - Only people inside the service know how to place new resources into the service., vs.
    - The specifications for entering the service are published and people outside the service can meet those specs.
  - **Generic vs. Domain specific**
    - Supports domain-neutral shallow interoperation, vs.
    - Supports domain-specific deep interoperation.

- **Examples**
  - Google: Open and Generic
  - Typology projects: Closed and Domain-specific
Dimensions of the Best

- Services that are Open + Domain-specific vary in:
  - **Scope**
    - The service operates over metadata, vs.
    - The service operates over a focused aspect of full content.
  - **Source of precision**
    - The depth is encoded in the form provided by archives, vs.
    - The depth is mined from shallow resources.

- **Examples**
  1. OLAC: Metadata and Precision-supplied
  2. Metaschema experiments: Data and Precision-supplied
  3. ODIN: Data and Precision-added
1. Open Language Archives Community

- An open standard for metadata and protocol for harvesting: www.language-archives.org
- 34 institutions now participate by contributing to a pooled catalog of language resources
- As part of E-MELD, Linguist List has developed a search service over that catalog:
  http://www.LinguistList.org/olac/
What the archive supplies

- `<olac:olac xsi:schemaLocation="http://www.language-archives.org/OLAC/1.0/
  http://www.language-archives.org/OLAC/1.0/olac.xsd

What the service reports

Document Information

General Description:

Title: Ega lexicon (Gbery)
Archive: U Bielefeld Language Archive
Archive URL: http://www.spectrum.uni-bielefeld.de/langdoc/
Creator(s): Gbery, Eddy Aime
            Baze, Lucien
Description: Ega lexicon in Shoebox format
Contributor(s): Lindenlaub, Juliane
Date: 2003-03
Coverage: Cote d'Ivoire
Format: shoebox
Language: French [fra]
          Ega [ega]
          English [eng]
Based on E-MELD founding principles

The inaugural EMELD workshop (2001) easily reached consensus on three points:

- XML descriptive markup provides the best format for the interchange and archiving of endangered language data.
- No single schema for XML markup can be imposed on all language resources.
- Linguists need to be able to perform queries across multiple resources.
A fundamental problem

- How to interoperate across resources when:
  - Those resources use different markup schemas
  - The linguists have used different terminology in their analysis and description

- The EMELD solution is based on GOLD:
  - General Ontology for Linguistic Description
  - Use a shared ontology of linguistic concepts as the basis for interoperation across disparate markup and terminologies
Converting from Markup to Meaning

- markup schema
  - A formal definition (as with XML DTD or XML Schema) of the vocabulary and syntax of markup for a class of source documents.

- semantic schema
  - A formal definition (as with RDF Schema or OWL) of the concepts in a particular domain.

- metaschema
  - A formal definition of how the elements and attributes of a markup schema are interpreted in terms of the concepts of a semantic schema.
A sample Hopi lexical entry

```xml
<Lexeme id="L28">
  <Head><Headword>
    <OrthographicForm>na('at)</OrthographicForm>
  </Headword></Head>
  <POS>
    <Feature name="cat">n</Feature>
    <Feature name="type">poss</Feature>
  </POS>
  <Sense><Gloss>
    <OrthographicForm>father. The term is applied to one’s natural father.</OrthographicForm>
  </Gloss></Sense>
</Lexeme>
```
A metaschema fragment

<interpret markup="Lexeme">
  <resource concept="gold:LinguisticSign"/>
</interpret>

<interpret markup="Head">
  <property concept="gold:form">
    <resource concept="gold:PhonologicalUnit"/>
  </property>
</interpret>

<interpret markup="OrthographicForm">
  <literal concept="gold:orthographicRepresentation"/>
</interpret>
The interoperable interpretation

E-MELD 2006, Lansing, MI  
25 June 20, 2006

father. The term is applied to one's natural father, 

<gold:form>
  <gold:PhonologicalUnit>
    <gold:orthographicRepresentation>na('at)</gold:orthographicRepresentation>
  </gold:PhonologicalUnit>
</gold:form>

<gold:meaning>
  <gold:SemanticUnit>
    <gold:definition>father. The term is applied to one's natural father,</gold:definition>
  </gold:SemanticUnit>
</gold:meaning>

<gold:grammar>
  <gold:GrammaticalUnit>
    <gold:hasPartOfSpeech rdf:resource="&gold;Noun" />
    <gold:hasFeature rdf:resource="&gold;InalienablyPossessed" />
  </gold:GrammaticalUnit>
</gold:grammar>
Best practice opens the playing field

- Linguist achieves best practice
  - Deposits resource in XML descriptive markup
- Archive achieves best practice
  - Supports access to that resource
- Service achieves best practice
  - Supports an open protocol on a focused data type
- Analyst can then bridge the interoperation gap
  - Analyst creates and archives a metaschema
  - Service harvests original resource + metaschema
Results to date

- Proof of concept on a small scale using Sesame (an open-source RDF database):
  1. Lexicons from 3 languages
  2. Interlinear texts from 7 languages
- See papers by Simons et al. at emeld.org
  - Project Documents
  - 2004 Workshop Proceedings
  - 2005 Workshop Proceedings
3. Mining the depths of shallow resources

- The service widely harvests shallow resources
  - E.g. through web crawling or Google API
  - Uses domain knowledge to add precision

- The service can serve at two levels:
  - Direct service to users who use it to access the harvested shallow resources
  - Indirect service through other services by implementing a best-practice (domain-specific) metadata provider
ODIN: Online Database of Interlinear Text

- See paper by Will Lewis at emeld.org
  - 2003 Workshop Proceedings

- Methodology
  - Seed Google search with abbreviations used in glossing
  - Keep URL if content has instances of text-gloss-translation
  - Use Ethnologue names data to propose language identify

- Service currently reports:
  - 33,713 instances of Interlinear Glossed Text examples
  - from 701 different languages
  - in 2,202 different linguistic documents
What the user sees

ODIN
The Online Database of Interlinear Text

List of documents and pages with Interlinear examples for Aceh (ATJ)
(Alternate names and dialects for Aceh are Achehnese, Achinese, Atjah, Atjehnese, Banda Aceh, Baruh, Bueng, Daja, Pase, Pedir, Pidie, Timu, and Tunong)

Services in a word

- Services give the linguist **POWER**.
- The best services offer:
  - Precision
  - Openness
  - Web harvesting
  - Enrichment
  - Reach
The elements of POWER

- **Precision**
  - Precision through domain-specific standards.

- **Openness**
  - Anyone can implement the supporting protocol.

- **Web harvesting**
  - Harvesting resources from around the Internet.

- **Enrichment**
  - Adding precision to resources born shallow.

- **Reach**
  - Searching resources from everywhere at once.
Conclusion: Toward best practice

- Digital language archiving holds the potential of unparalleled access to information, but only if:
  - Linguists do LOTS MORE to ensure that the resources they create endure far into the future.
  - Archives do MUCH to ensure the preservation of those resources.
  - Services give users POWER to retrieve everything that is relevant (and only what is relevant).
  - The linguistics community embraces the domain-specific standards that support interoperation.
